

**JANDEL**

## Cylindrical Probe Mounting Adaptor

Jandel Engineering offers the mounting block that is used on Jandel four point probing systems as an option for use in mounting the Cylindrical Probe onto custom fixtures. The mounting block is made of black anodized aluminum. The Cylindrical probe is secured by a thumbscrew. The block has some existing mounting holes, however, additional mounting holes can be drilled and tapped into the block by the end user as needed.

When sold for use with the Jandel Hi-Vac version of the Cylindrical probe, which is designed to be used in a vacuum environment, the mounting adaptor is sold in a non-anodized version.
